

ABSTRACT

A method for producing a hair-fixing product in the form of a foil is described whereby first
5 a viscous, rollable composition is prepared by dissolving or dispersing a polymer in a liquid carrier medium and then the composition is shaped into a foil by rolling it with the aid of a rolling device and the liquid carrier medium is evaporated. Also described are hair-styling foils that contain at least one hair-fixing polymer and advantageously additional
10 surfactants or polyols and that preferably are treated with an adhering, powdered, hydrophobic release agent.
